

Wheat Disease Monitoring in Punjab

Date: August 24, 2026

1. Introduction

Punjab is one of India's leading wheat-producing states, contributing significantly to the national food security. Over the past decade, wheat production has faced challenges from several fungal diseases that reduce yield and grain quality. Monitoring these diseases is essential for implementing timely interventions and safeguarding farmers' livelihoods.

2. Disease Overview

The most prevalent wheat diseases in Punjab include Leaf Rust (*Puccinia striiformis*), Stem Rust (*Puccinia graminis*), and Fusarium Head Blight (FHB) caused by *Fusarium graminearum*. These pathogens thrive under the region's temperate climate and high humidity during the rainy season, leading to significant yield losses if not managed effectively.

3. Comparative Analysis

Disease	Amritsar	Ludhiana	Jalandhar
Leaf Rust	12%	18%	15%
Stem Rust	5%	9%	7%
Fusarium Head Blight	3%	4%	2%

4. Incidence Trends
